

BUCKINGHAMSHIRE WATERMILLS

BUCKINGHAMSHIRE COUNTY MUSEUM ARCHAEOLOGICAL GROUP

The object of this gazetteer is to present an overall view of the former distribution of watermills in Buckinghamshire. A gazetteer of windmill sites has already been published in *Recs. Bucks* 20 (1978), 516-524. Many people have had a hand in its compilation and, to achieve consistency, the compilers sought to answer three specific questions about each modern civil parish in the county:

1. Was there ever a watermill, or mills, in this parish?
2. Where were they?
3. When were they operating?

The gazetteer is based on a search of relatively accessible sources including maps, local and county histories, field names, etc., and, whilst it is thought that the majority of mills have been identified, it will be apparent that there is much scope for further research. The modern county of Buckinghamshire has been studied and parishes transferred to adjacent counties, including Eton, Horton, Linslade, Slough and Wraysbury are excluded. The first of the three maps (Fig. 1) which accompany the gazetteer shows the overall distribution of watermills plotted by modern civil parish. The larger-scale maps of the north and south of the county (Figs. 2 and 3) show the actual number of mills in each parish and their siting, with the exception of the unlocated category 3 mills (see below) whose presence is indicated by a square.

Mill sites have been grouped into four categories as follows:

1. Site of mill identifiable to an eight-figure national grid reference, by authority of an Ordnance Survey map and occasionally of extant remains.
2. Mill location known with reasonable

accuracy from maps other than those of the Ordnance Survey, or from documentary sources, occasionally supported by extant remains or field names.

3. Mill known to exist in parish from documentary evidence (excepting Domesday), but location on the ground not known.

4. Probable watermill site deduced from field name or field observation, or combination of both.

In view of the difficulty of demonstrating continuity of site between mills recorded in Domesday Book and later mills, and also the vagaries of the Domesday record (Darby 1977, 270-275), the Domesday mills are separately listed beneath each parish entry. There remains, however, an element of presumption concerning continuity of site. Where, for example, there is but one mill in a parish in the fourteenth century and only one mill is referred to in the eighteenth century, site continuity has been assumed in view of the capital investment required for the construction of leats, ponds, etc. That this assumption may occasionally prove erroneous has been demonstrated by excavation of a mill at Caldecotte, Bow Brickhill (Petchey 1981) which produced no structural evidence earlier than the eighteenth century despite there being evidence for a mediaeval mill in the parish. In this instance two mill sites are presumed to have existed.

The second column of the gazetteer gives a museum reference number where further detail relevant to each entry is filed. The dates given in the two final columns are the earliest and latest dates at which a mill is known to have been working on that site utilising water power, but do not necessarily cover its complete working life and it is here that further local research would be particularly useful.

From the mid-nineteenth century many watermills utilised steam power. Kelly's Directory from 1883 onwards conveniently records which corn mills used steam power, and the advent of steam has normally been given as the terminal date for water-powered operations at these mills. For paper mills on the Wye and Thames this information is not so readily available and the date of introduction of steam power, if and when it took place, is less clear. In these cases, where paper products continued to be manufactured at the mill, the latest known working date of the mill as a unit is given unless the last use of water power is known from another source.

Although the vast majority of mills recorded in the county were flour mills, paper mills were of considerable importance on the River Wye and individual mills were also involved with paper production at one time or another at Amersham, Bledlow, Buckingham, Chenies, Chesham, Great Brickhill, Iver, Lower Winchendon, Marlow, Marsworth and Taplow. Fulling mills are recorded at Chenies, Chesham, Chepping Wycombe, Denham, Latimer, Medmenham, Newport Pagnell, Newton Blossomville, Taplow, Tyringham and Wendover. At Chalfont St. Peter and probably Amersham there was a silk mill and at Iver a cotton mill. A few small mills were constructed in the nineteenth and twentieth centuries for special purposes: for example a saw mill was powered from the lake at Wotton Underwood, at Denham a tiny mill was constructed for general farm use including operation as a swede and chaff cutter, and at Wexham a water-powered turbine built c. 1865 powered both corn mill and sawmill. It should be noted that a number of mills changed their function over the course of time, and some were capable of milling more than one product.

To an extent the distribution of watermills complements that of windmills, but in a number of instances both occur in one parish and in fourteen parishes, for example Creslow, Oakley and Fulmer, neither has been recorded. This may in part be due to boundary changes.

shire at 78 places; 38% of the places noted in the survey had mills attributed to them (Darby 1977). Although mills with vertical wheels have been recorded on a number of sites of the Roman period in Britain and a late Saxon example is recorded at Old Windsor, a mill building excavated at Tamworth and dendro-chronologically dated to A.D. 855 ± 9 was designed for a horizontally-wheeled mill (Rahtz 1981, and Baillie 1982, 180-195 and 259-260) and small mills of this kind operated recently in Scotland and Ireland. Either type of mill may thus be indicated by the Domesday entries. Both would be accompanied by earthworks such as mill ponds and leats and in the absence of a mill building the survival of these earthworks often provides a useful clue to the former existence of a mill site, as may the distribution of stone fish-basket weights (Mynard 1979).

Several mill buildings survive in the county, including some still used as mills such as Walton, Aylesbury. However the original water-powered machinery is believed to have been removed from the interior of all with the exception of Castlethorpe, Tingewick, Thornborough and Ford End Mill at Ivinhoe, which is currently undergoing restoration. This mill is occasionally open to the public.

The gazetteer, despite a great deal of work, remains a preliminary statement, and supplementary information and corrections would be welcomed. For those undertaking further research, attention should be drawn to the Simmons Collection in the Science Museum Library, London, which incorporates unpublished Buckinghamshire material, based largely on that collected by Mr. Stanley Freese, and which is not otherwise readily available. Finally, acknowledgement should be made to the many members of the County Museum Archaeological Group who contributed to this survey, in particular to the following who have been responsible for its final format: Kathy Edmonds, Joan Elding, Margaret Gornall, Joyce Mellor and Marjorie Whiteman. In addition Andrew Pike has made many useful comments and provided a number of references.

Domesday records 135 mills in Buckingham-
